

# Parameter-Efficient Fine-Tuning (PEFT)

**Kun Yuan**

**Peking University**

- Fine-tuning in LLMs refers to the process of taking a pre-trained model and further training it on a more specific dataset
- Finetuning will adapt LLM to a particular task or domain. This allows the model to better understand and generate relevant responses for the specific task than pretrained model
- Finetune is an important technique to help you utilize LLMs into your own private applications

## Fine-tuning (微调)

### 优势:

- **任务适应性:** 通过在特定任务的数据集上训练, 模型可以更好地适应特定任务的需求。
- **性能提升:** 在许多情况下, 微调可以显著提高模型在特定任务上的性能。
- **端到端训练:** 微调允许模型以端到端的方式学习任务, 从而可能捕获更复杂的模式。

### 劣势:

- **数据需求:** 需要大量标注数据来微调模型, 这在某些情况下可能是限制因素。
- **过拟合风险:** 在数据量有限的情况下, 微调可能导致过拟合。
- **计算资源:** 微调需要较多的计算资源, 尤其是对于大型模型。

### 适用场景:

- **定制化任务:** 当需要对模型进行特定定制, 以适应特定的业务需求或领域时。
- **数据丰富:** 当有足够的标注数据可用于训练时。
- **性能关键:** 当任务性能至关重要, 需要模型尽可能精确时。

Fine-tuning 适用于有  
足够标注数据、需要  
高性能定制的场景

## Prompting (提示)

### 优势:

- **数据效率**: 不需要或只需要很少的标注数据, 适用于数据稀缺的场景。
- **泛化能力**: 模型不需要针对特定任务进行调整, 因此可能具有更好的泛化能力。
- **快速适应**: 可以快速适应新任务, 无需额外的训练过程。

### 劣势:

- **性能限制**: 相比于微调, 提示可能无法达到最佳性能, 尤其是在复杂任务上。
- **提示工程**: 需要精心设计提示, 这可能需要领域知识和实验。
- **解释性挑战**: 提示方法的输出可能不如微调模型那样直观易懂。

### 适用场景:

- **数据稀缺**: 当标注数据有限或难以获取时。
- **快速迭代**: 当需要快速适应新任务或领域时。
- **探索性任务**: 当需要模型提供初步的、探索性的结果时。

Prompting适用于  
数据稀缺、需要快  
速适应新任务

## Retrieval Augmented Generation (RAG)

### 优势:

- **上下文检索**: RAG结合了检索和生成的能力, 可以从大量文本中检索相关信息来增强生成的内容。
- **知识更新**: RAG可以动态地检索最新的信息, 使其在知识更新方面比仅依赖于预训练知识的模型更具优势。
- **减少偏见**: 通过检索外部信息, RAG可以减少模型内部可能存在的偏见。

### 劣势:

- **检索质量**: 生成内容的准确性高度依赖于检索系统的质量, 如果检索到的信息不准确, 生成的内容也可能不准确。
- **计算资源**: 检索过程增加了额外的计算负担。
- **实时性**: 对于需要实时响应的应用场景, 检索过程可能会引入延迟。

### 适用场景:

- **知识密集型任务**: 当任务需要大量知识或事实信息时, 如问答系统或文章生成。
- **实时信息**: 当需要访问最新信息或实时数据时。
- **多样性需求**: 当需要生成多样化的内容, 而不只是依赖于模型内部的知识时。

RAG适用于需要动态检索外部知识、生成多样化内容的场景, 且对实时性要求不高

# Finetune is essentially retraining the model with nice initialization

Pretrain

[Image is from a [Medium Blog](#)]

# Finetune is essentially retraining the model with nice initializations

Finetune

[Image is from a [Medium Blog](#)]

# Finetuning LLM is very expensive

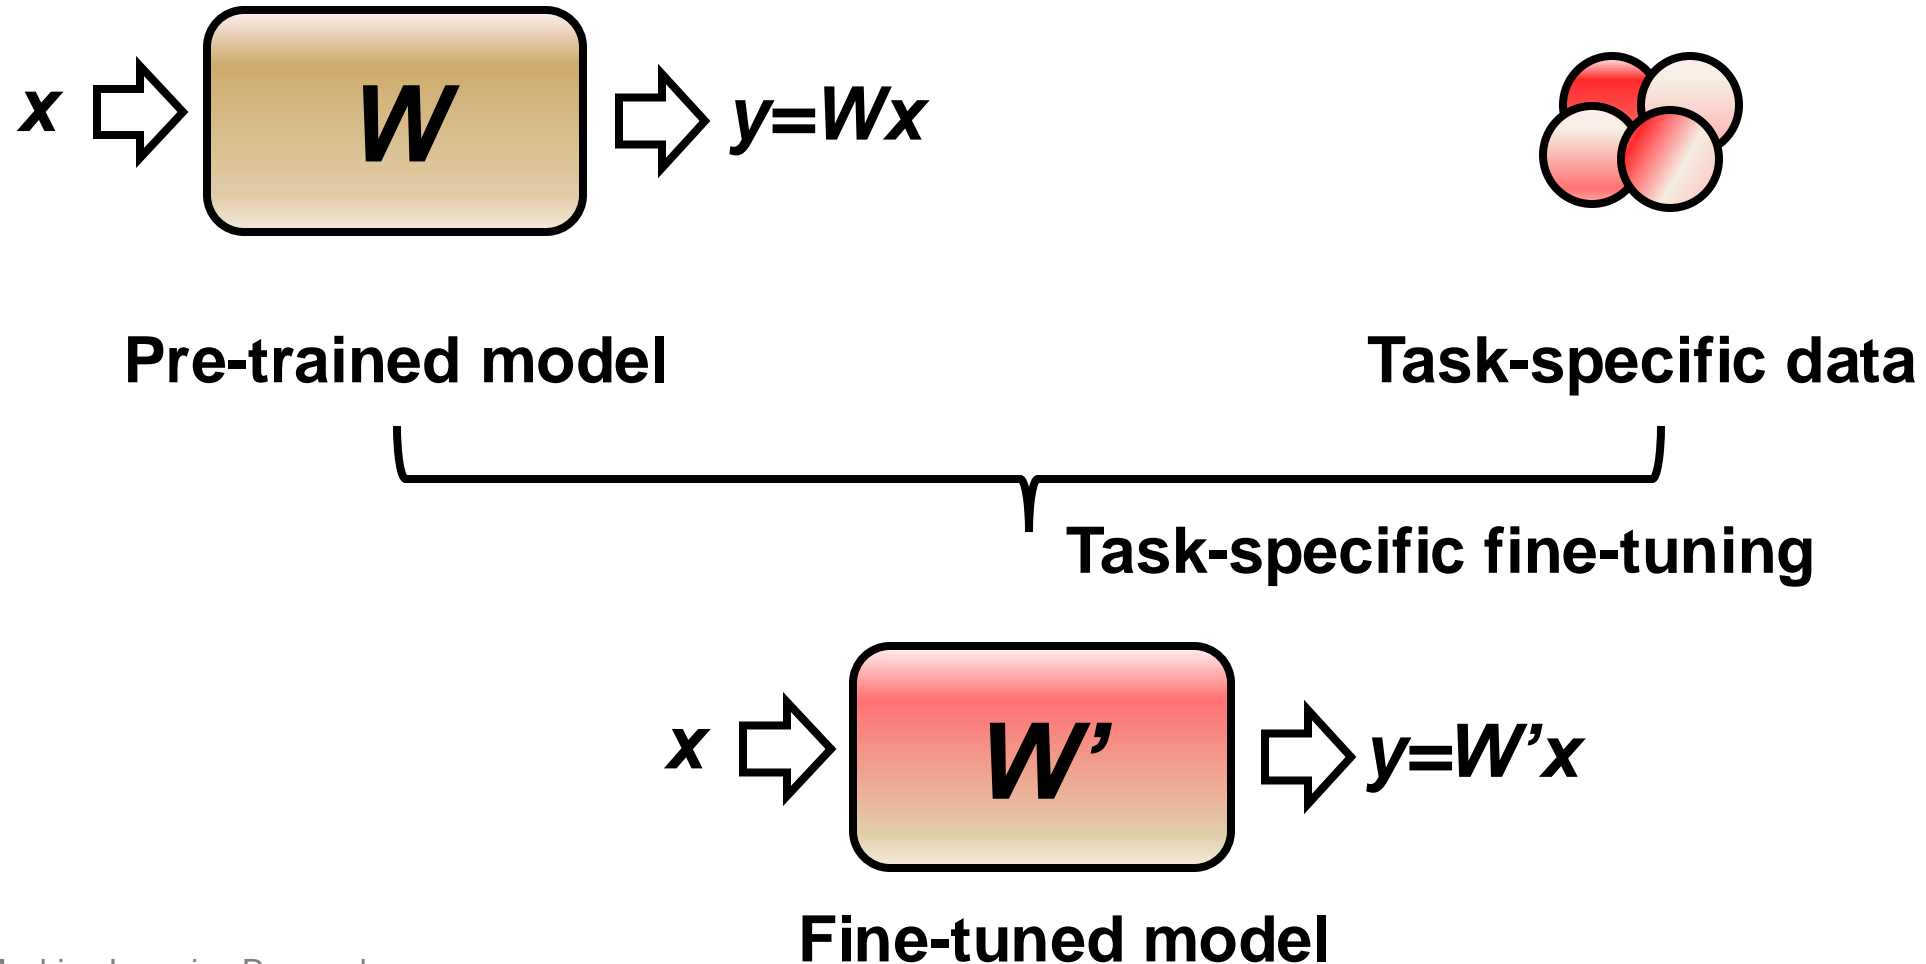

---

- **Computational Resources:** Finetuning LLMs, especially the latest ones with billions of parameters like GPT-3 or GPT-4, requires substantial computational power.
- **Data Requirements:** Finetuning an LLM effectively requires a significant amount of high-quality, domain-specific data. Gathering, cleaning, and preparing this data can be labor-intensive and costly.
- **Expertise:** The process of finetuning an LLM requires expertise. Hiring or consulting with experts to handle the finetuning process adds to the overall cost.
- **Maintenance and Experimentation:** Iterative experimentation is often necessary to achieve optimal performance. This means multiple rounds of training, evaluation, and tweaking, each consuming additional resources

# Model Fine-tuning

- Model fine-tuning helps to adapt the model to specific downstream tasks.

# Why do we need parameter-efficient fine-tuning?

- Full fine-tuning requires **the same memory consumption as pre-training**.

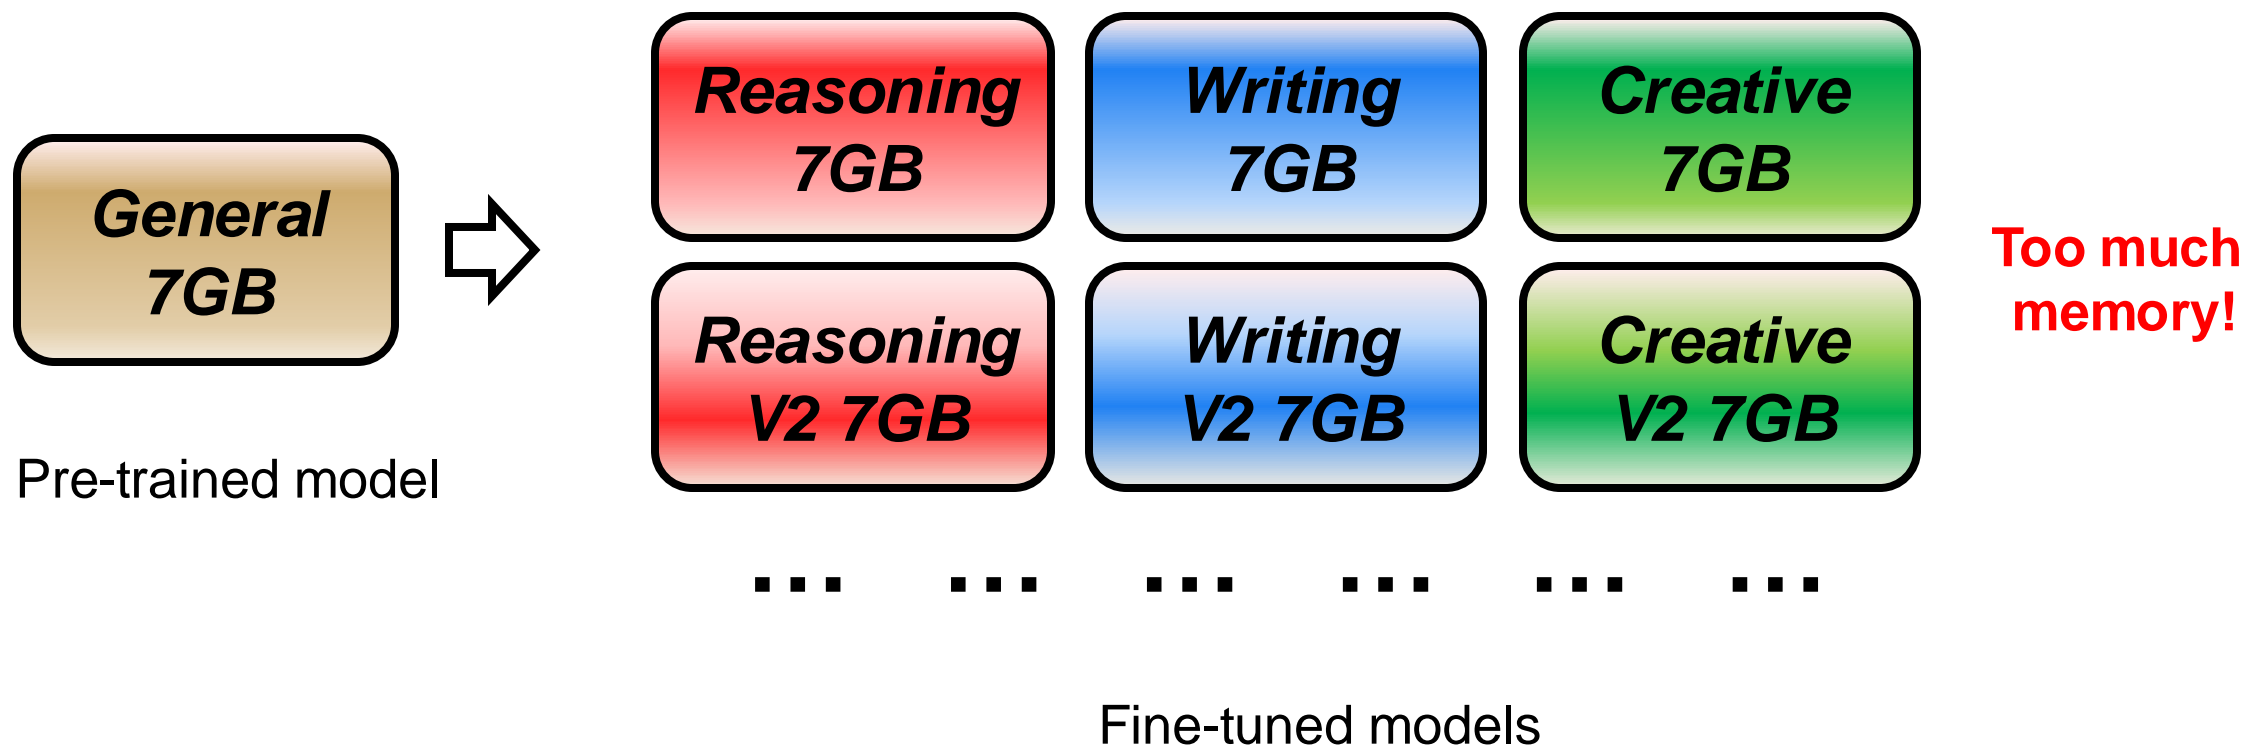

- Parameters: 7B
- Model storage:  $7\text{B} * 2 \text{ Bytes} = 14 \text{ GB}$
- Gradient storage: 14 GB
- Optimizer states: 28 GB (using Adam)
- Activation storage: 2 GB [Zhao et. al., 2024]
- In total: **58 GB**

- Generally, models are pre-trained with lots of GPUs, which may not be easily accessible.

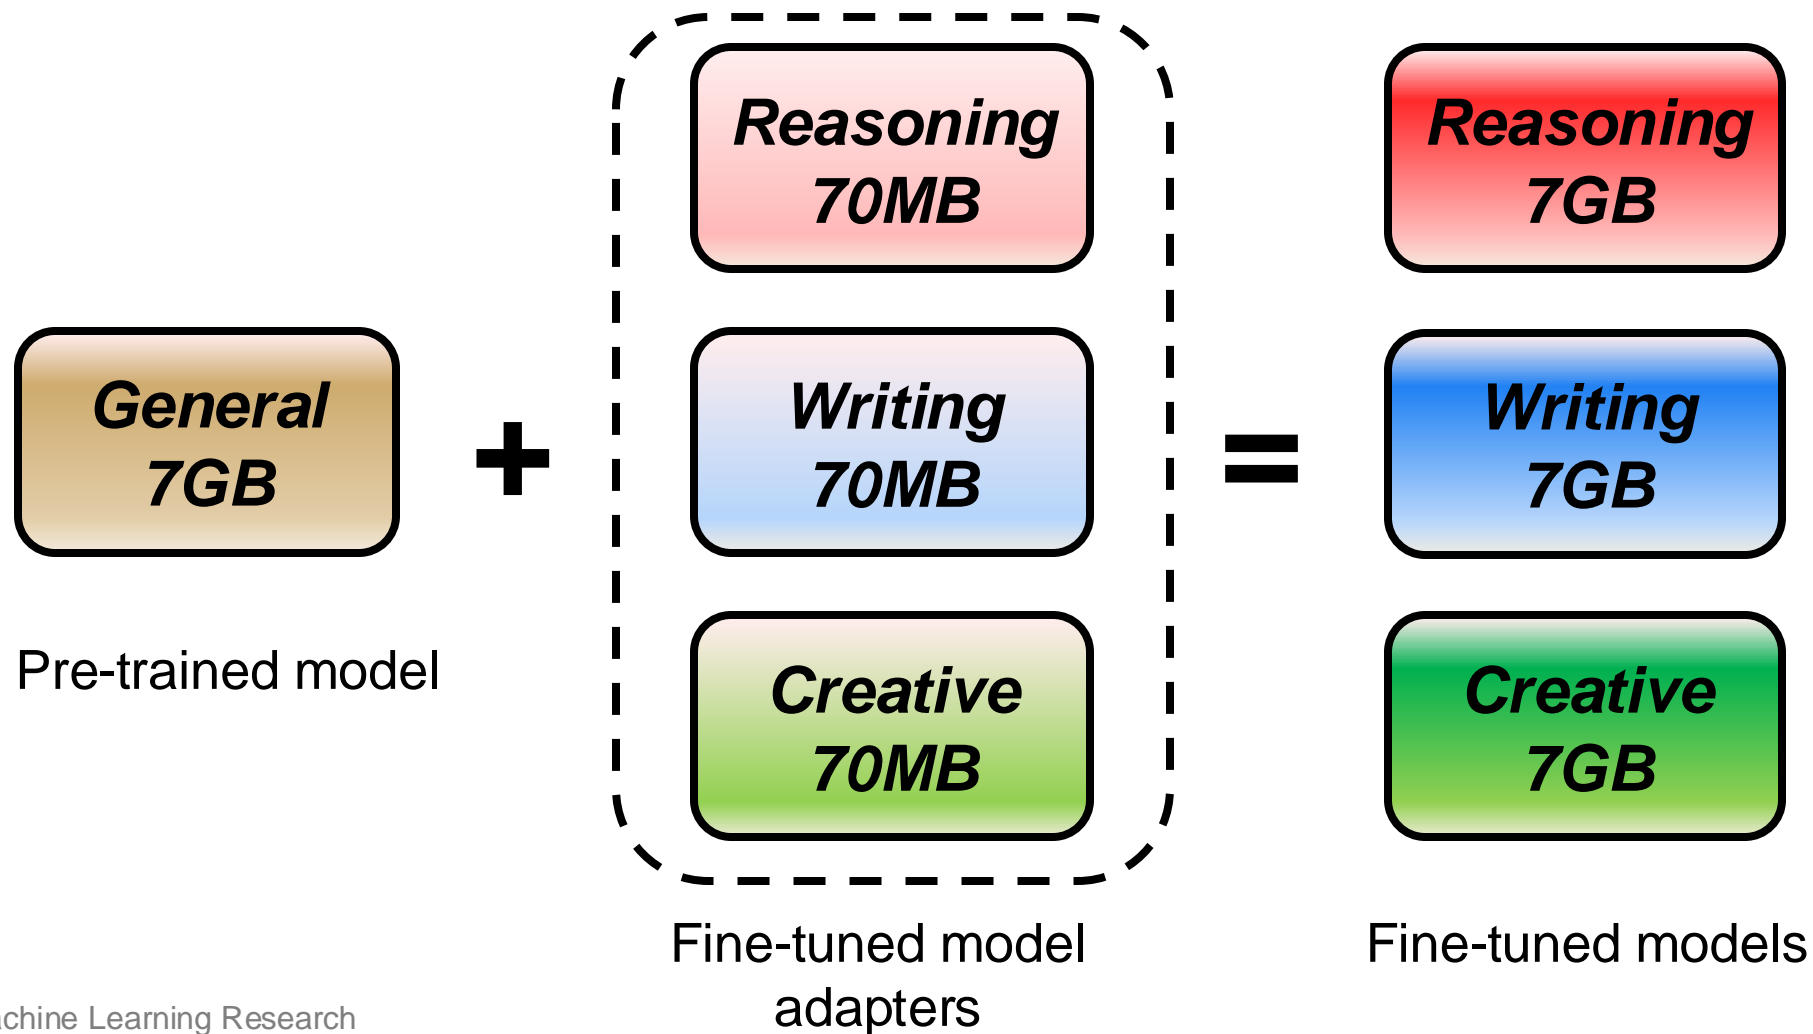

# Why do we need parameter-efficient fine-tuning?

- For different downstream tasks / model versions, it is also **expensive** to store a full-size checkpoint for each fine-tuned model.

# Parameter-efficient adapters

- Applying task-specific adapters, we can obtain task-specific models.

# BitFit: Bias-terms Fine-tuning

- BitFit only fine-tunes the bias terms across all model layers.

Attention Projection:

$$\begin{aligned} \mathbf{Q}^{m,\ell}(\mathbf{x}) &= \underbrace{\mathbf{W}_q^{m,\ell}}_{\text{Frozen}} \mathbf{x} + \underbrace{\mathbf{b}_q^{m,\ell}}_{\text{Trainable}} \\ \mathbf{K}^{m,\ell}(\mathbf{x}) &= \underbrace{\mathbf{W}_k^{m,\ell}}_{\text{Frozen}} \mathbf{x} + \underbrace{\mathbf{b}_k^{m,\ell}}_{\text{Trainable}} \\ \mathbf{V}^{m,\ell}(\mathbf{x}) &= \underbrace{\mathbf{W}_v^{m,\ell}}_{\text{Frozen}} \mathbf{x} + \underbrace{\mathbf{b}_v^{m,\ell}}_{\text{Trainable}} \end{aligned}$$

Multi-head Attention:  $\mathbf{h}_1^\ell = att(\mathbf{Q}^{1,\ell}, \mathbf{K}^{1,\ell}, \mathbf{V}^{1,\ell}, \dots, \mathbf{Q}^{m,\ell}, \mathbf{K}^{m,\ell}, \mathbf{V}^{m,\ell})$

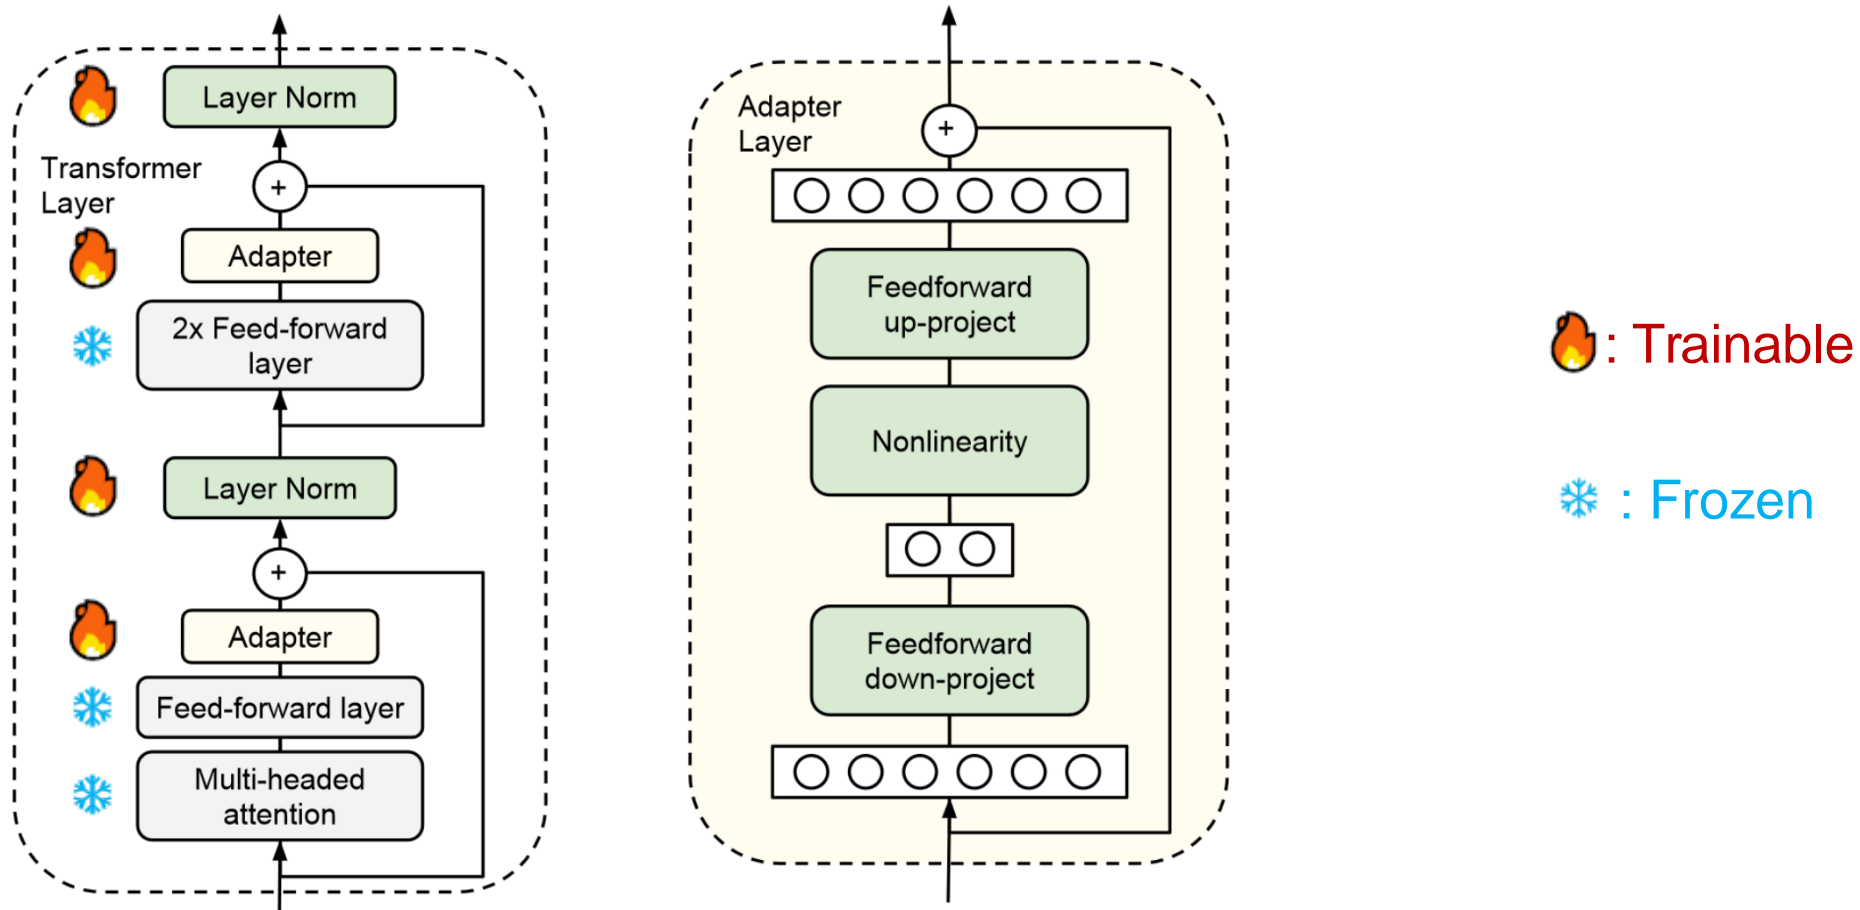

# BitFit: Bias-terms Fine-tuning

- BitFit only fine-tunes the bias terms across all model layers.

Dropout Layer 1:	$\mathbf{h}_2^\ell = \text{Dropout}(\mathbf{W}_{m_1}^\ell \cdot \mathbf{h}_1^\ell + \mathbf{b}_{m_1}^\ell)$
Layer Normalization 1:	$\mathbf{h}_3^\ell = \mathbf{g}_{LN_1}^\ell \odot \frac{(\mathbf{h}_2^\ell + \mathbf{x}) - \mu}{\sigma} + \mathbf{b}_{LN_1}^\ell$
GELU Activation:	$\mathbf{h}_4^\ell = \text{GELU}(\mathbf{W}_{m_2}^\ell \cdot \mathbf{h}_3^\ell + \mathbf{b}_{m_2}^\ell)$
Dropout Layer 2:	$\mathbf{h}_5^\ell = \text{Dropout}(\mathbf{W}_{m_3}^\ell \cdot \mathbf{h}_4^\ell + \mathbf{b}_{m_3}^\ell)$
Layer Normalization 2:	$\text{out}^\ell = \mathbf{g}_{LN_2}^\ell \odot \frac{(\mathbf{h}_5^\ell + \mathbf{h}_3^\ell) - \mu}{\sigma} + \mathbf{b}_{LN_2}^\ell$
	<div style="display: flex; justify-content: space-around; align-items: center;"><div style="border: 1px dashed blue; padding: 5px;"><b>Frozen</b></div><div style="border: 1px dashed red; padding: 5px;"><b>Trainable</b></div></div>

# Adapter-H: Houlsby Architecture

- Adapter-H inserts additional layers in each transformer layer.

## LoRA: LOW-RANK ADAPTATION OF LARGE LANGUAGE MODELS

# Finetuning LLM with low-rank adaptation

- Full Parameter Fine-tuning:

$$\min_{W \in \mathbb{R}^{p \times q}} \mathbb{E}_{\xi \sim \mathcal{D}} [F(W; \xi)]$$

- Finetuning with low-rank adaptation:

$$\min_{A \in \mathbb{R}^{p \times r}, B \in \mathbb{R}^{r \times q}} \mathbb{E}_{\xi \sim \mathcal{D}} [F(W + AB; \xi)]$$

New knowledge and expertise are imposed through low rank matrices A and B

# Finetuning LLM with low-rank adaptation

- Finetuning with low-rank adaptation:

$$\min_{A \in \mathbb{R}^{p \times r}, B \in \mathbb{R}^{r \times q}} \mathbb{E}_{\xi \sim \mathcal{D}} [F(W + AB; \xi)]$$

Only A and B are to be trained, while W is fixed

$$W' = W + \Delta W = W + AB$$

$$W'x = (W + AB)x = Wx + ABx$$

# Full parameter fine-tuning: Memory cost

$x$                        $h|z$                        $\hat{y}$

$$\frac{\partial f}{\partial B_1} = A_1^T \frac{\partial f}{\partial h} (x)^T$$

$$\frac{\partial f}{\partial h} = \frac{\partial f}{\partial z} \odot \nabla \sigma(h)$$

$$\frac{\partial f}{\partial z} = (W_2 + A_2 B_2)^T \frac{\partial f}{\partial \hat{y}}$$

$$\frac{\partial f}{\partial A_2} = \frac{\partial f}{\partial \hat{y}} (B_2 z)^T$$

$$\frac{\partial f}{\partial B_2} = A_2^T \frac{\partial f}{\partial \hat{y}} (z)^T$$

$$\frac{\partial f}{\partial \hat{y}} = \nabla L(\hat{y})$$

**Store  $\nabla_{A_1} f$ ,  $\nabla_{B_1} f$  and  $\nabla_{A_2} f$ ,  $\nabla_{B_2} f$**

# How much memory can LoRA save?

- Memory cost:

Memory cost = Models + Grads + Optimizers + Activations

- LoRA does **not save activation-incurred memory**; does not apply to scenarios where activation-incurred memory dominates, e.g., long-context transformers
- LoRA **saves models/grads/optimizers** from  $O(p*q)$  to  $O((p+q)*r)$
- LoRA can save great memory when rank  $r$  is small, and activation-incurred memory is trivial

- Since one of the matrices A or B will be initialized to 0, it will be very slow for it to update
- We should use different learning rates for A and B; LoRA+

	LoRA	LoRA+
Parameterization	<div> <div>Pretrained Weights <math>W \in \mathbb{R}^{n \times n}</math></div> <div>+</div> <div>B</div> <div>×</div> <div>A</div> </div>	
Training	$A \leftarrow A - \eta \times G_A$ $B \leftarrow B - \eta \times G_B$	$A \leftarrow A - \eta \times G_A$ $B \leftarrow B - \lambda \eta \times G_B$ $\lambda \gg 1$

[LoRA+: Efficient Low Rank Adaptation of Large Models]

- We should use different learning rates for A and B; LoRA+

[LoRA+: Efficient Low Rank Adaptation of Large Models]

- A matrix can be decomposed into the magnitude and the direction

$$W = m \frac{V}{\|V\|_c} = \|W\|_c \frac{W}{\|W\|_c}$$

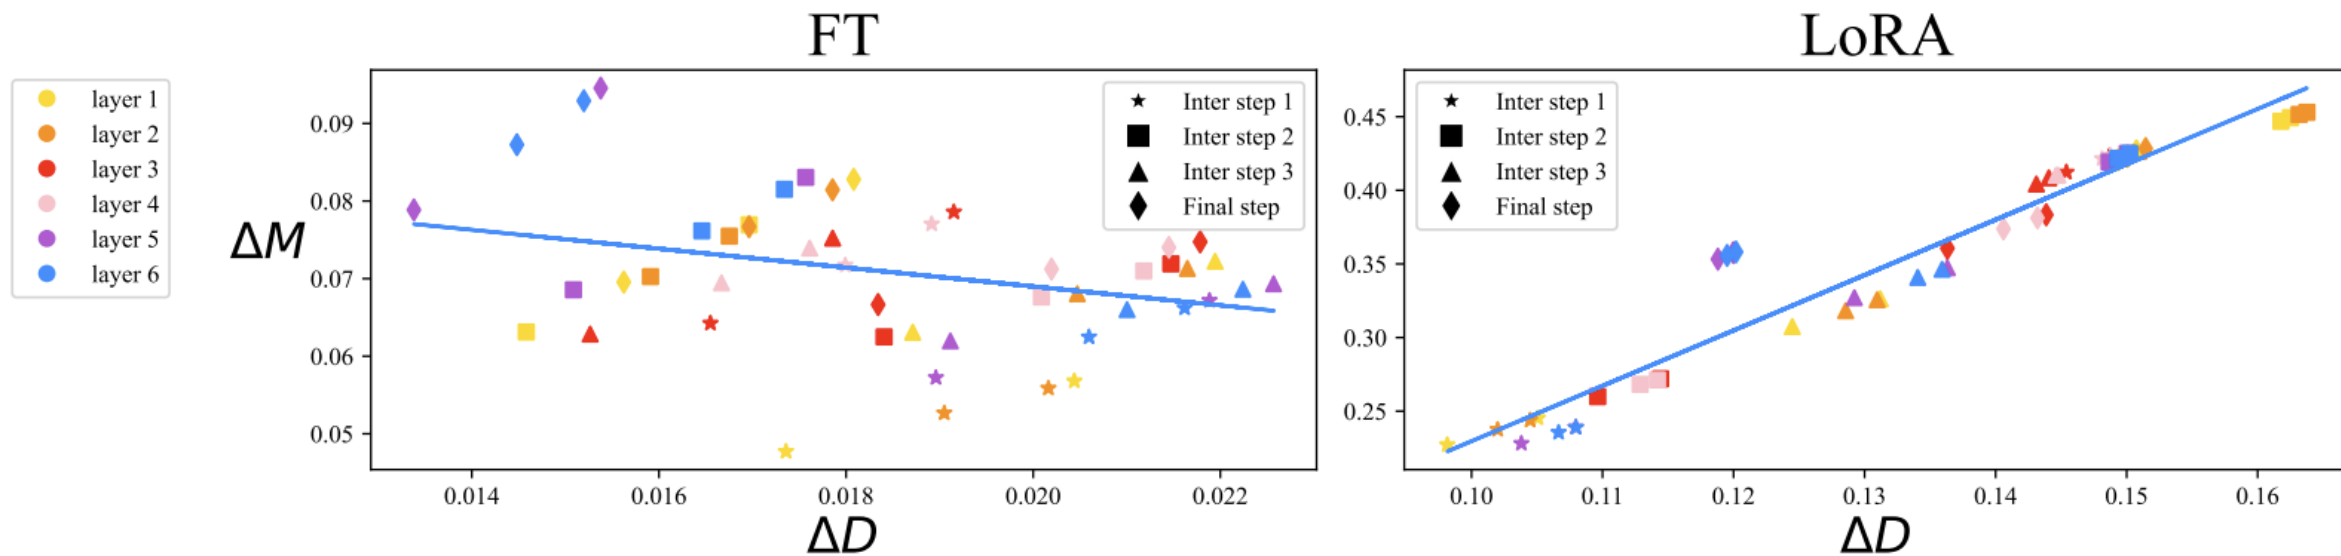

- The magnitude and directional variations between  $W_0$  and  $W_{\text{FT}}$  can be defined as follows:

$$\Delta M_{\text{FT}}^t = \frac{\sum_{n=1}^k |m_{\text{FT}}^{n,t} - m_0^n|}{k}$$
$$\Delta D_{\text{FT}}^t = \frac{\sum_{n=1}^k (1 - \cos(V_{\text{FT}}^{n,t}, W_0^n))}{k}$$

- Similarly, the magnitude and directional variations between  $W_0$  and  $W_{\text{LoRA}}$  are:

$$\Delta M_{\text{LoRA}}^t = \frac{\sum_{n=1}^k |m_{\text{LoRA}}^{n,t} - m_0^n|}{k}$$
$$\Delta D_{\text{LoRA}}^t = \frac{\sum_{n=1}^k (1 - \cos(V_{\text{LoRA}}^{n,t}, W_0^n))}{k}$$

# Weight-Decomposed Low-Rank Adaptation (DoRA)

Slight-negatively proportional

Positively proportional

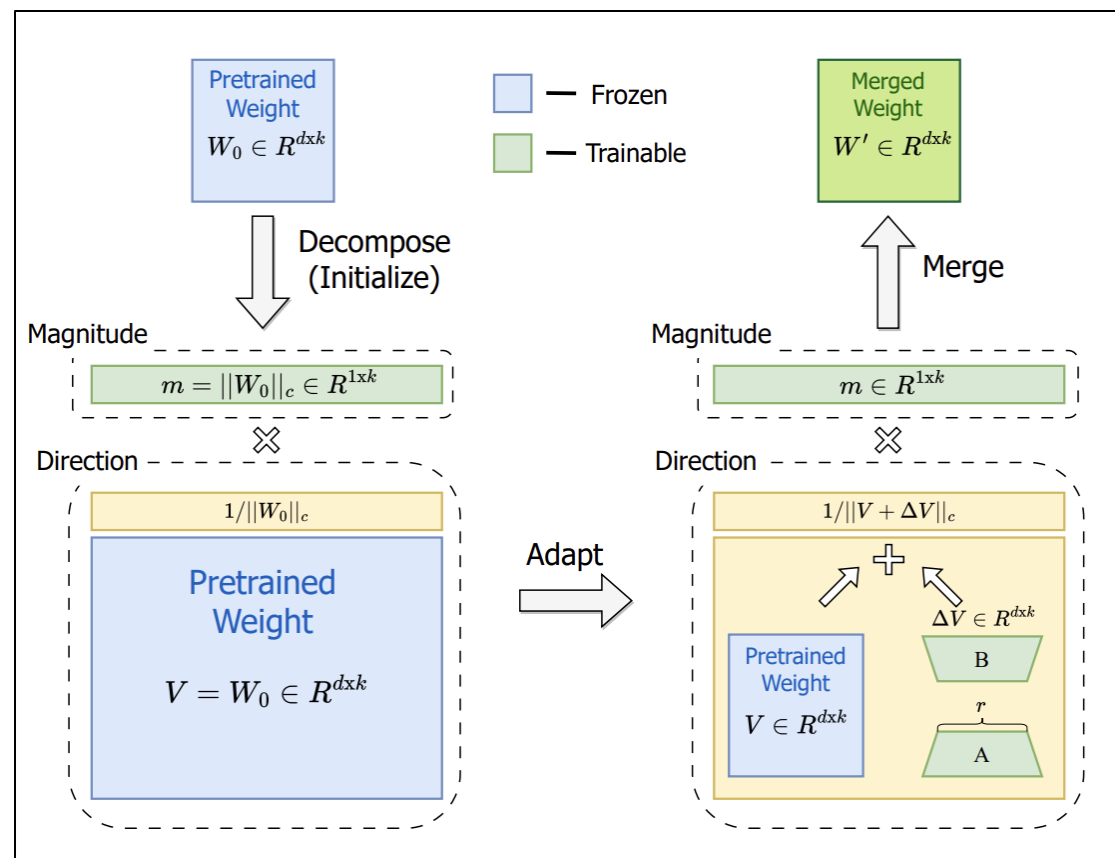

- This reflects the difference between LoRA and FT

# Weight-Decomposed Low-Rank Adaptation (DoRA)

- DoRA: train the magnitudes and directions separately

$$W' = \underline{m} \frac{V + \Delta V}{\|V + \Delta V\|_c} = \underline{m} \frac{W_0 + \underline{BA}}{\|W_0 + \underline{BA}\|_c}$$

# Weight-Decomposed Low-Rank Adaptation (DoRA)

Slight-negatively proportional

Negatively proportional

- DoRA is consistent with FT

# Weight-Decomposed Low-Rank Adaptation (DoRA)

- LoRA does not update the whole model. Instead, it only update a low-rank incremental model

$$\min_{A \in \mathbb{R}^{p \times r}, B \in \mathbb{R}^{r \times q}} \mathbb{E}_{\xi \sim \mathcal{D}} [F(W + AB; \xi)]$$

- Can we update the full parameters in a memory-efficient manner? This can significantly increase the learnable parameters, which is expected to lead to superior performance
- Main idea: Layer-wise finetuning

$$\min_W \mathbb{E}_{\xi \sim \mathcal{D}} [F(W; \xi)] = \mathbb{E}_{\xi \sim \mathcal{D}} [F(W_1, W_2, \dots, W_L; \xi)]$$

where  $W := \{W_1, W_2, \dots, W_L\}$ . When update  $W_\ell$ , the other layers remain freeze

[LISA: Layerwise Importance Sampling for Memory-Efficient Large Language Model Fine-Tuning]

---

**Algorithm 1** Layerwise Importance Sampling AdamW (LISA)

---

**Require:** number of layers  $N_L$ , number of iterations  $T$ , sampling period  $K$ , number of sampled layers  $\gamma$ , initial learning rate  $\eta_0$

- 1: **for**  $i \leftarrow 0$  to  $T/K - 1$  **do**
  - 2:   Freeze all layers except the embedding and language modeling head layer
  - 3:   Randomly sample  $\gamma$  intermediate layers to unfreeze
  - 4:   Run AdamW for  $K$  iterations with  $\{\eta_t\}_{t=ik}^{ik+k-1}$
  - 5: **end for**
-

Forward

Store  $h, z$  and  $\hat{y}$

$$\frac{\partial f}{\partial W_1} = \frac{\partial f}{\partial h} x^T$$

$$\frac{\partial f}{\partial h} = \frac{\partial f}{\partial z} \odot \nabla \sigma(h)$$

$$\frac{\partial f}{\partial W_2} = \frac{\partial L}{\partial \hat{y}} z^T, \quad \frac{\partial f}{\partial z} = W_2^T \frac{\partial L}{\partial \hat{y}}$$

$$\frac{\partial f}{\partial \hat{y}} = \nabla L(\hat{y})$$

Backward

Store  $\nabla_{W_1} f(W_1)$  and  $\nabla_{W_2} f(W_2)$

# LISA performance

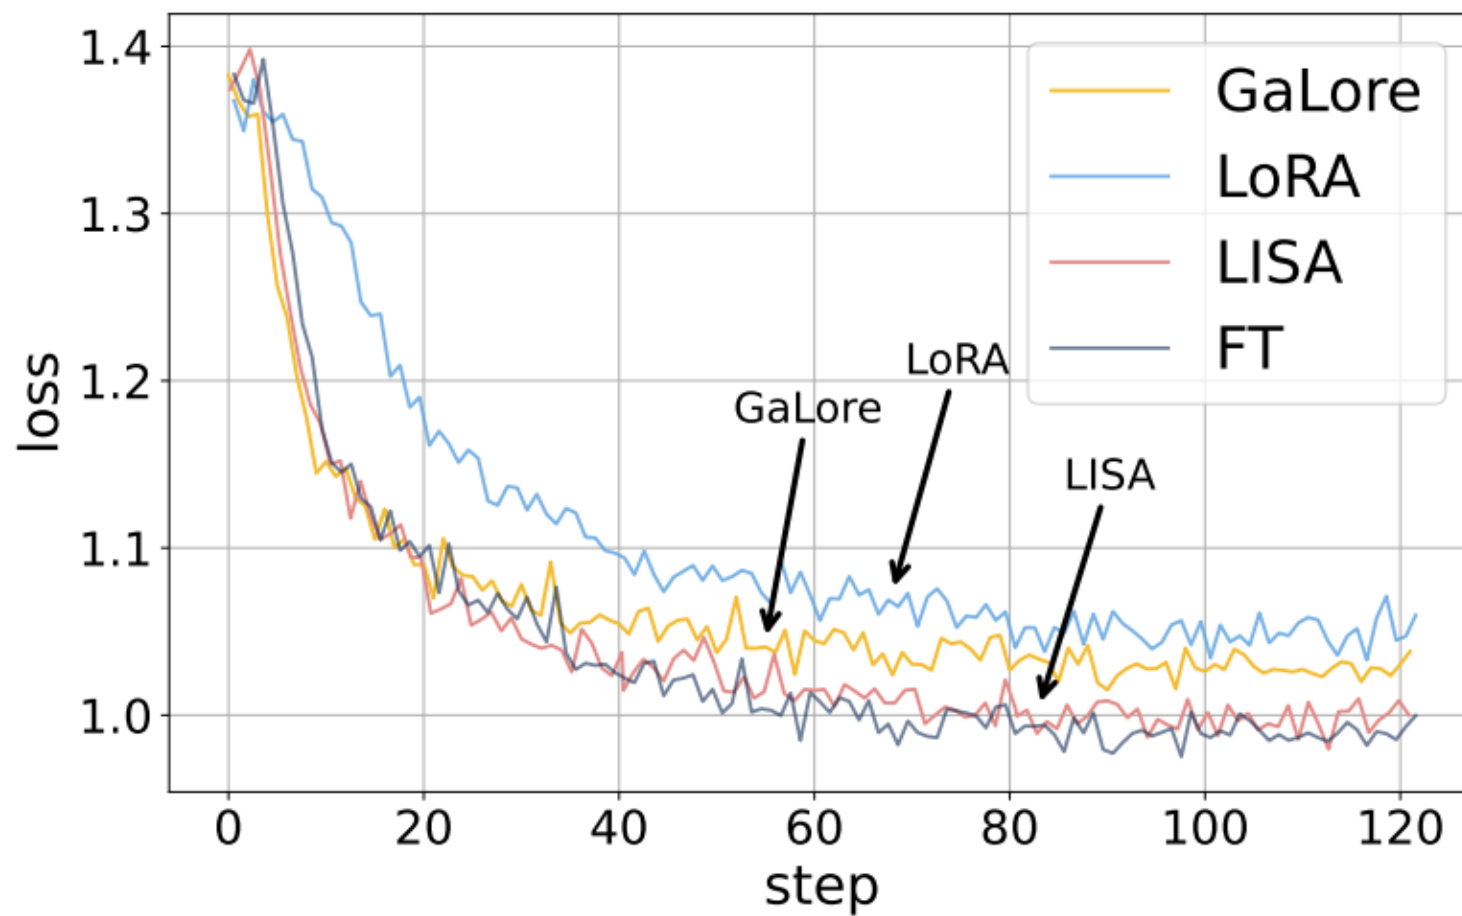

Table 2: Results of different methods on MMLU, AGIEval, and WinoGrande, measured by accuracy.

MODEL	METHOD	MMLU (5-SHOT)	AGIEVAL (3-SHOT)	WINOGRANDE (5-SHOT)
